

Hi Customer!

I have completed the design of the landing page. This page will be responsive for both mobile as desktop. It has a dropdown feature for the navigation bar (header) which collapses when the max-width reaches the px of a standard mobile screen. The content on the page are set to have a width % and height % so that they fit compared to the using device screen.

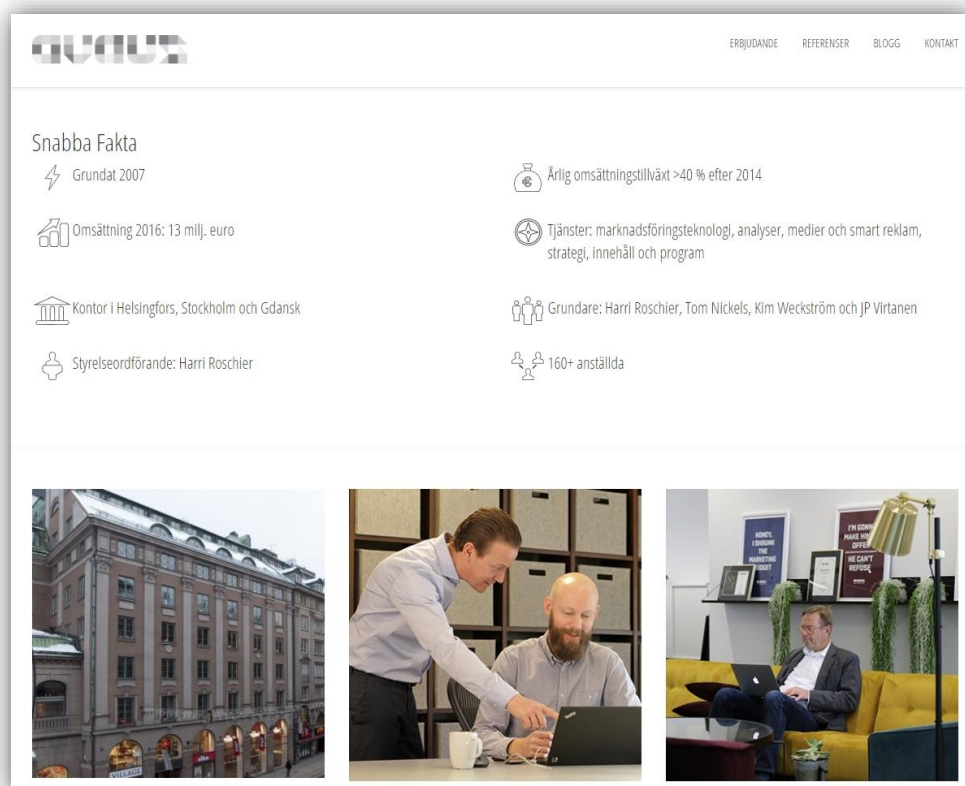

The header logo (image), "key persons" (text) and footer (boolean) are now all editable in Marketo:

- The header logo can now be swapped to another image.
- The div text area for key persons can now be edited.
- The footer is now toggleable. It can now be either hidden or shown.

All of this can be edited using the Marketo Landing Page editor.

The time for this project was on an estimate about 5 hours of work.

Initially I downloaded all the content needed (as image files etc.). I then started of with the HTML to sort out all of the sections and divs needed. After this I filled in all the content and then began with the css styling of the page. All of the script and style tags are included in the same index.html file so that the template can easier be downloaded and used without having extra folders or files. This page uses internal CSS to easier access the full source code.

A first overview of the landing page.

The rows are now in one column in device size to fit better to the screen. On the second picture is the collapse feature button which is toggleable when device screen is in mobile size.

Best regards,
Daniel Pagoldh
